NETWORK LAB REPORT

CO6 : Use Cisco Packet Tracer software to do experiments.

Name: Ritabroto Ganguly
Roll: 001910501090
BCSE-III, A3

ASSIGNMENT-6

Use Cisco Packet Tracer software to do the following experiments

OVERVIEW

Cisco Packet Tracer is one of the most useful visual simulation programs for networking certifications. With this tool, students are able to experiment with network behaviour. As such, they're able to ask a wide range of questions and explore different scenarios for better results. Since Cisco Packet Tracer is an important part of the Networking Academy, it provides students with an extensive learning experience. Additionally, it offers several visualizations, simulation, assessment, collaboration, and authoring capabilities to facilitate hassle-free learning and teaching of complex IT concepts.

GOALS

Install the Cisco Packet Tracer in the local machine and simulate the different network configurations as given in the questions.

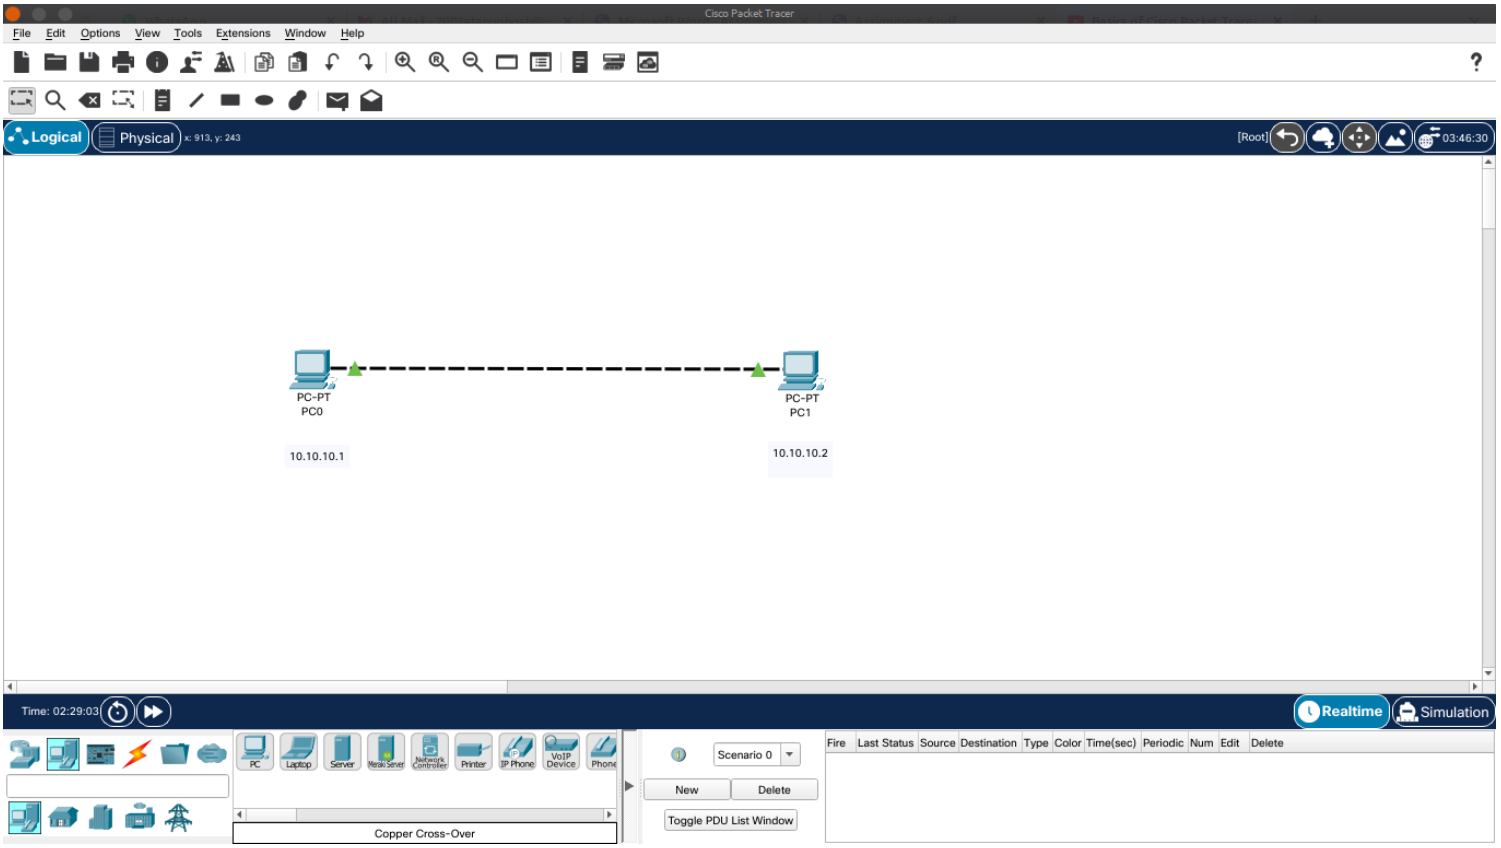
Specifications:

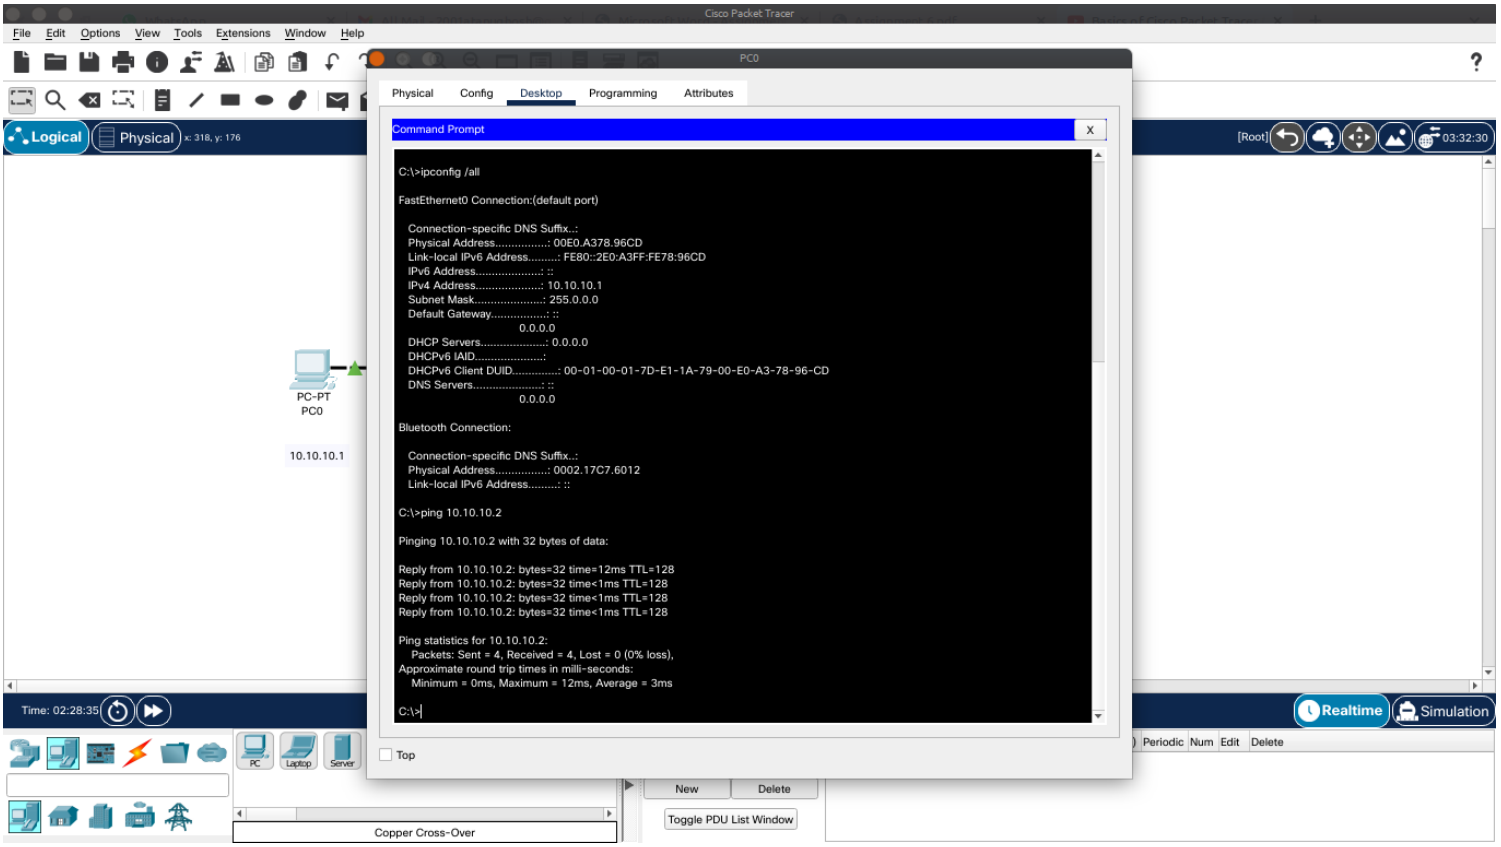
1. **OS :** Linux
2. **Distro :** Ubuntu 20.04 LTS
3. **Version :** PacketTracer 8.0.1

Questions and Solutions:

Q1. Connect two hosts back-to-back with a cross over cable. Assign IP addresses, and see whether they are able to ping each other.

Two hosts were made and connected with a crossover cable. The IP addresses assigned to them were 10.10.10.1 and 10.10.10.2. The following results were obtained.





Cisco Packet Tracer

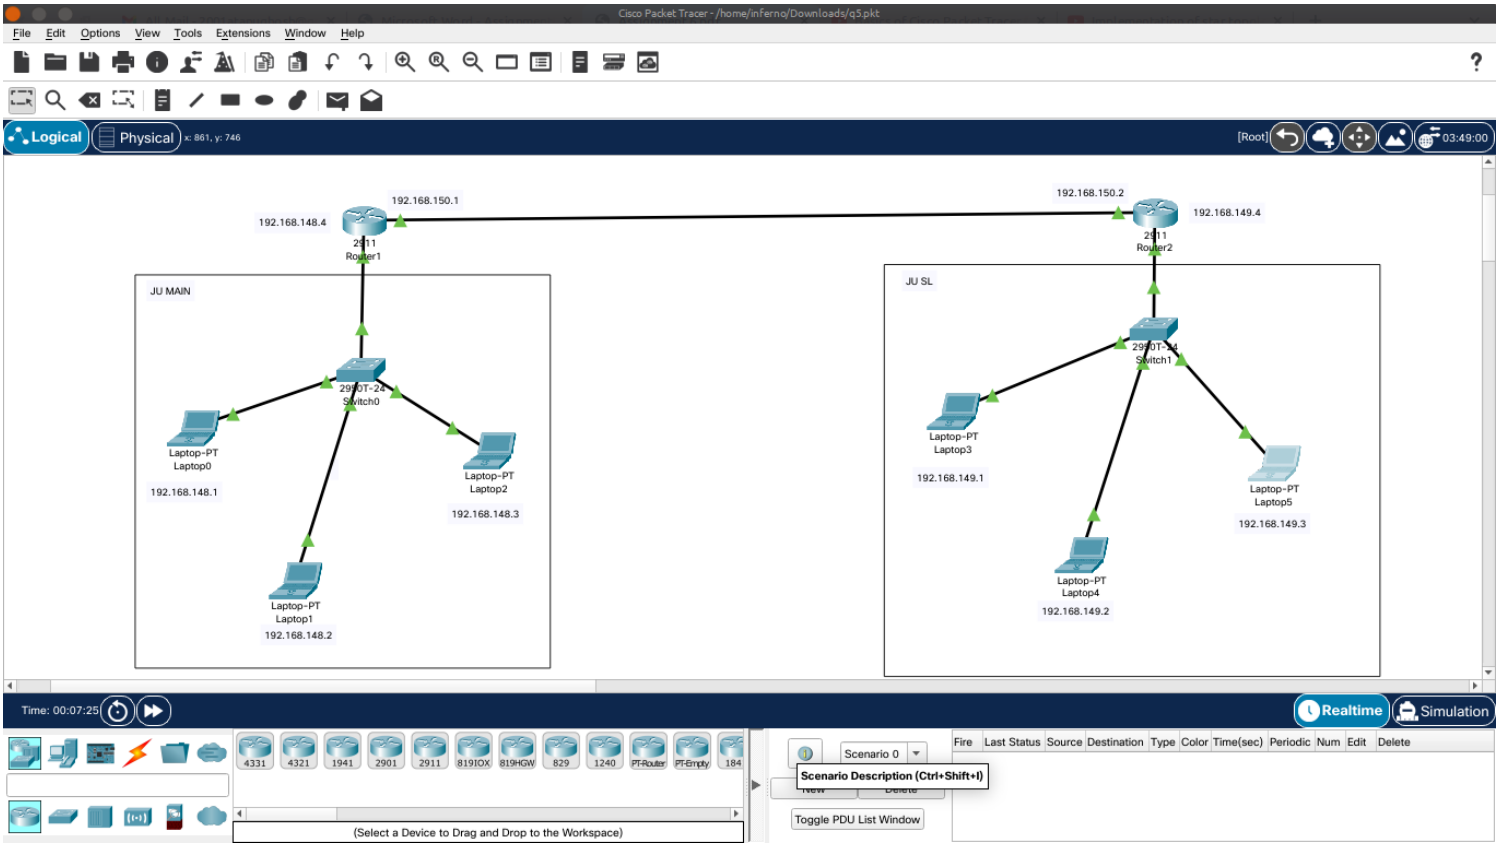
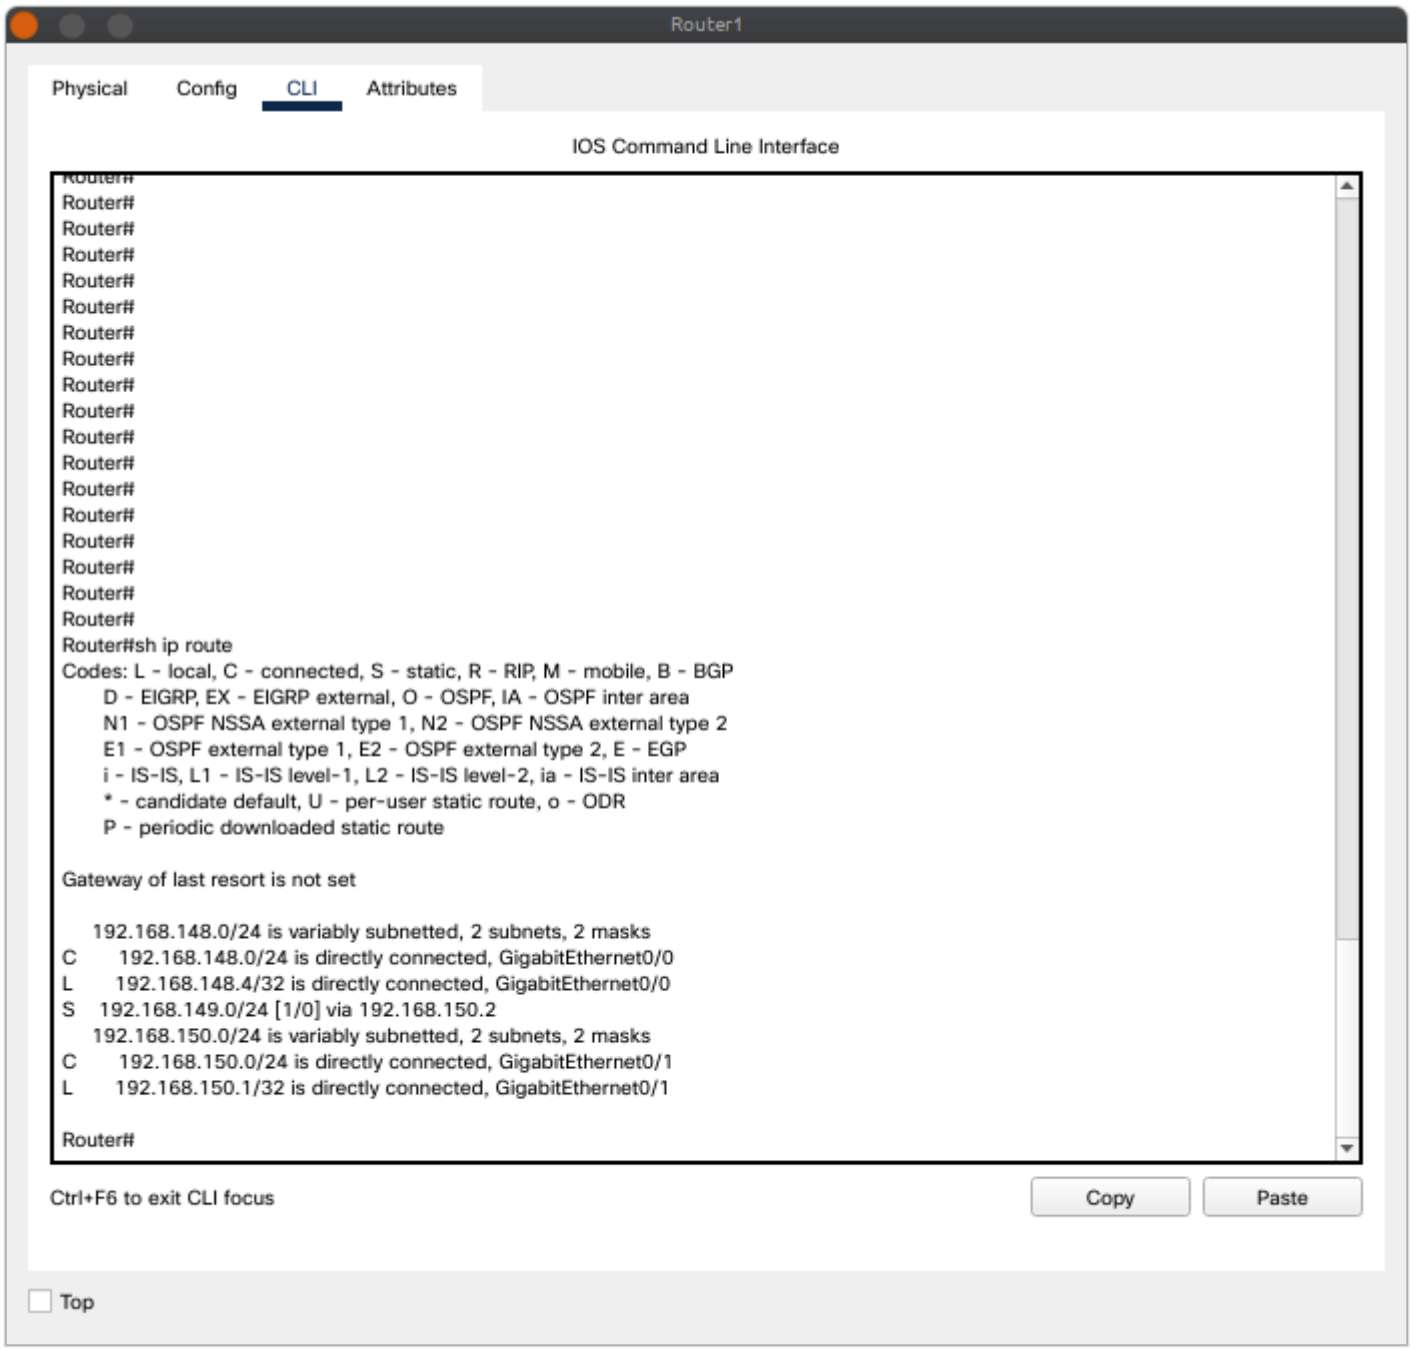
Q5. Create a LAN (named JU-Main) with three hosts connected via a layer-2 switch (Cisco 2950 switch PC-LAB1-Switch). Connect the switch to a router (Cisco 1818). Assign IP addresses to all the hosts and the router interface connected to this LAN from network 192.168.148.0/24. Configure default gateway of each hosts as the IP address of the interface of the router which is connected to the LAN. Create another LAN (named JU-SL) with three hosts connected via a layer-2 switch (Cisco 2950 switch PC-LAB2-Switch). Connect this switch to another router (Cisco 1818). Assign IP addresses to all the hosts and the router interface connected to this LAN from network 192.168.149.0/24. Configure default gateway of each hosts as the IP address of the interface of the router which is connected to the LAN. Connect the two routers through appropriate WAN interfaces. Assign IP addresses to the WAN interfaces from network 192.168.150.0/24. Add static route in both of the routers to route packets between two LANs.

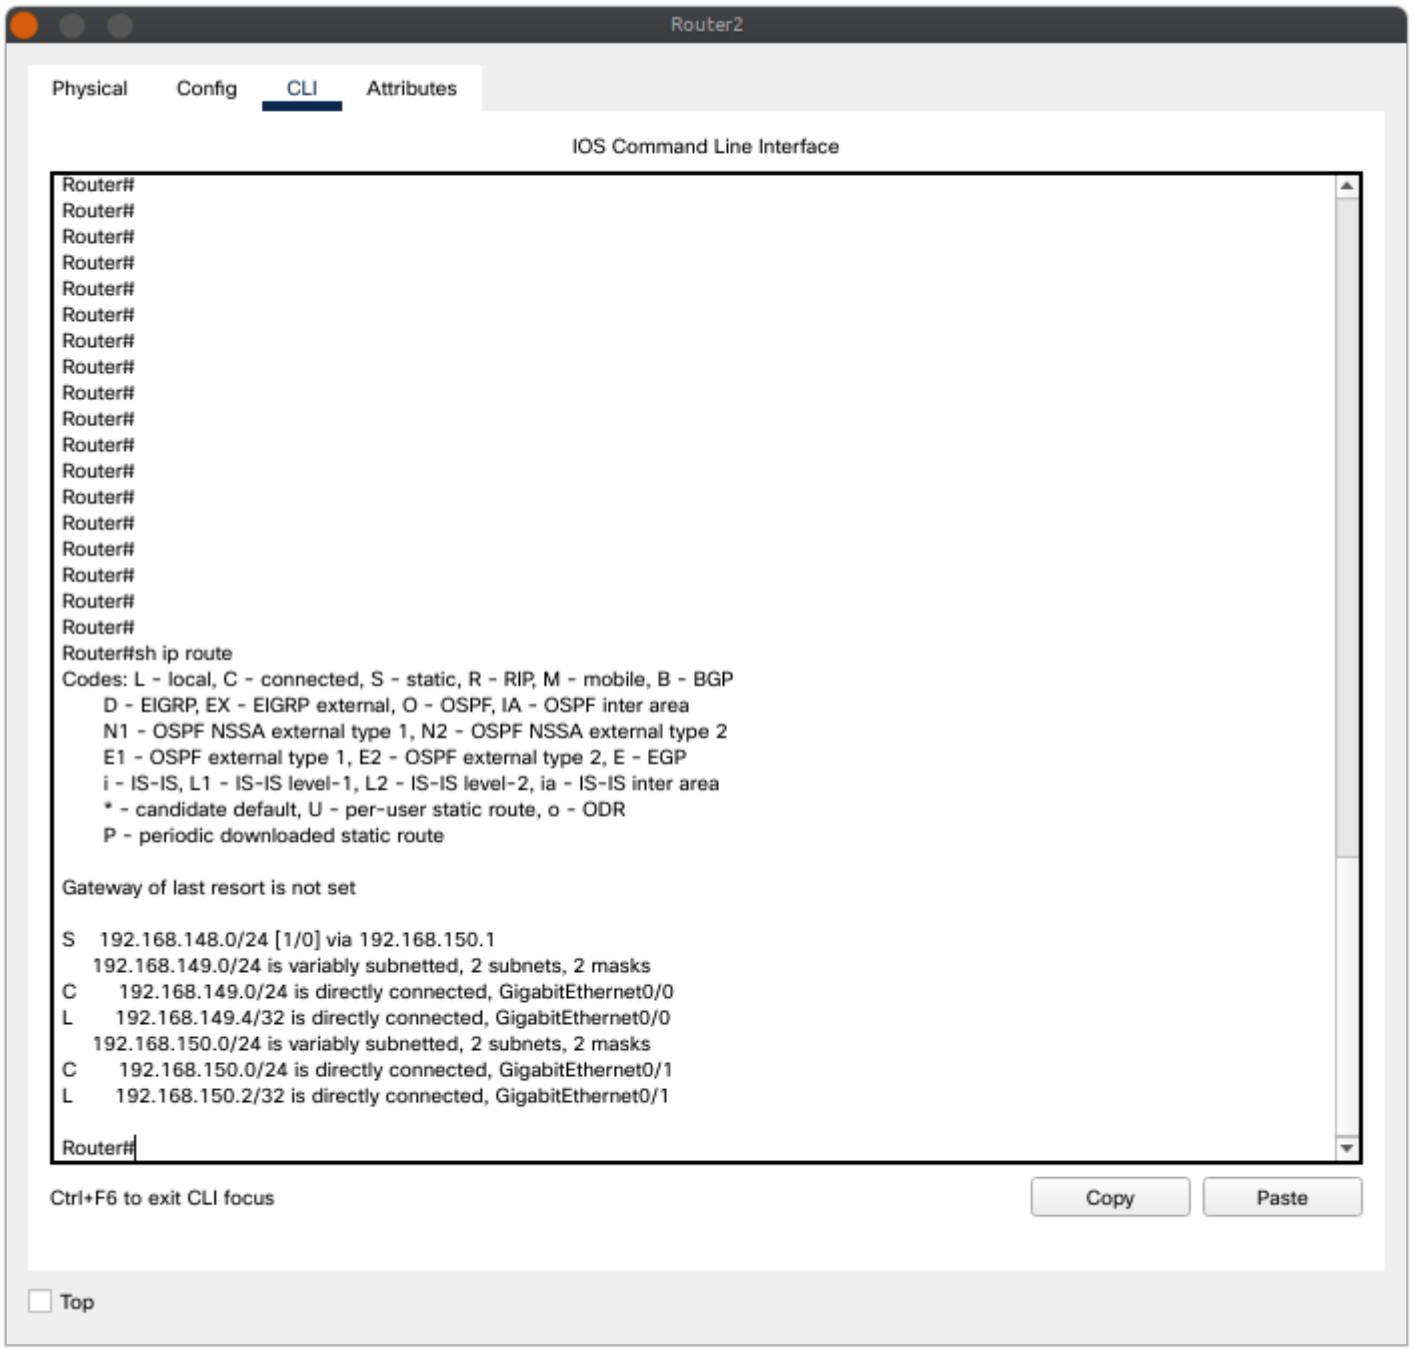
Two separate LANs were created using a switch and three hosts per LAN. Now, both the LANs are connected to one router each. The routers are further connected using a straight-through cable. The IP addresses were set according to the given question. Now, a static route is added between the two routers for communication. After that, ping requests were successfully made between the two different LANs.



IP Route of router 1 (JU MAIN) :



IP Route of router 2 (JU SL) :



Samples of PING executed between the two LANs:

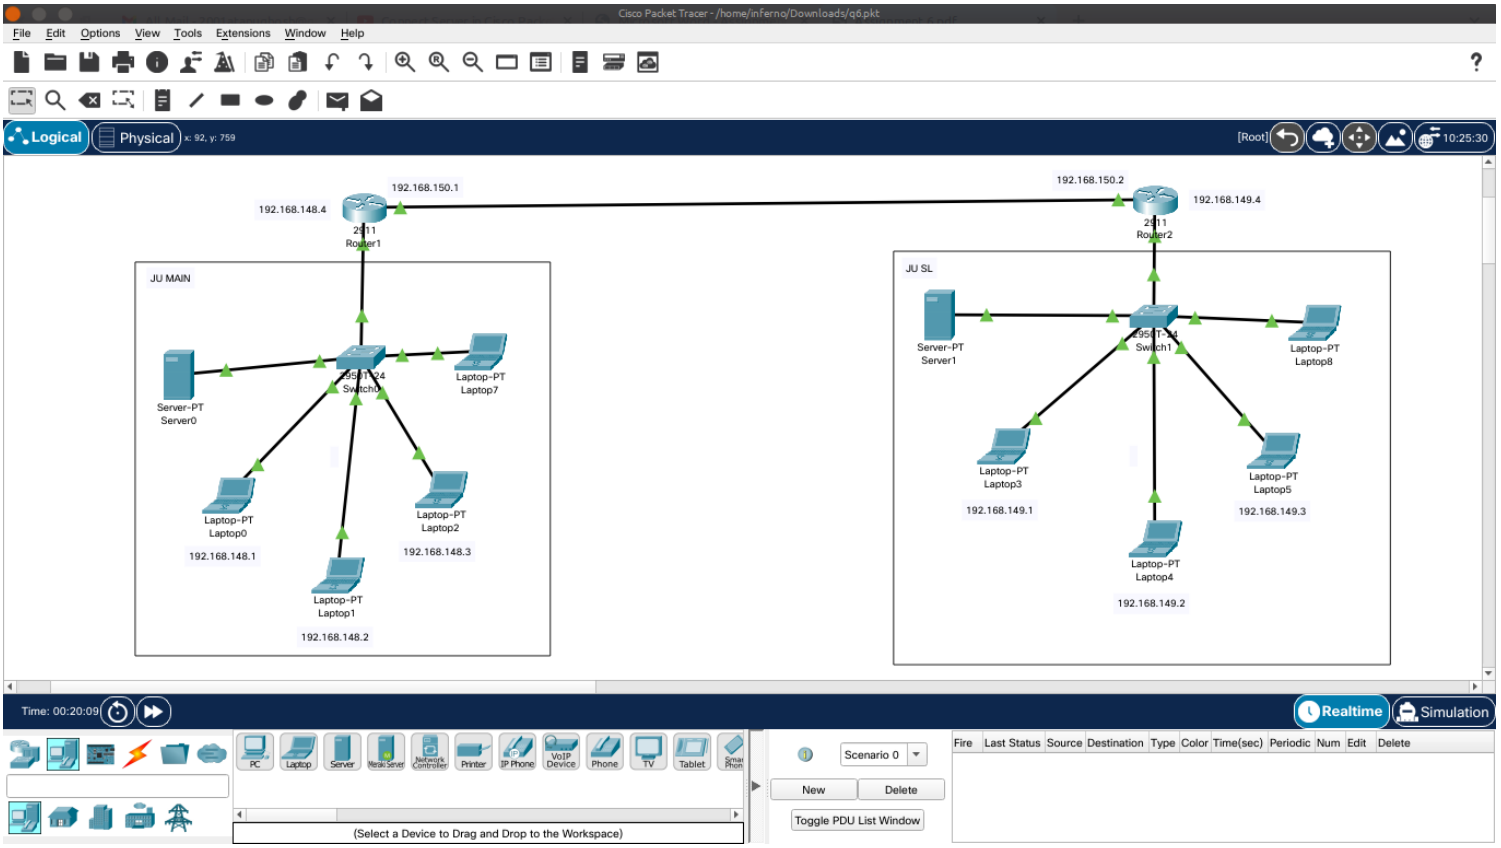
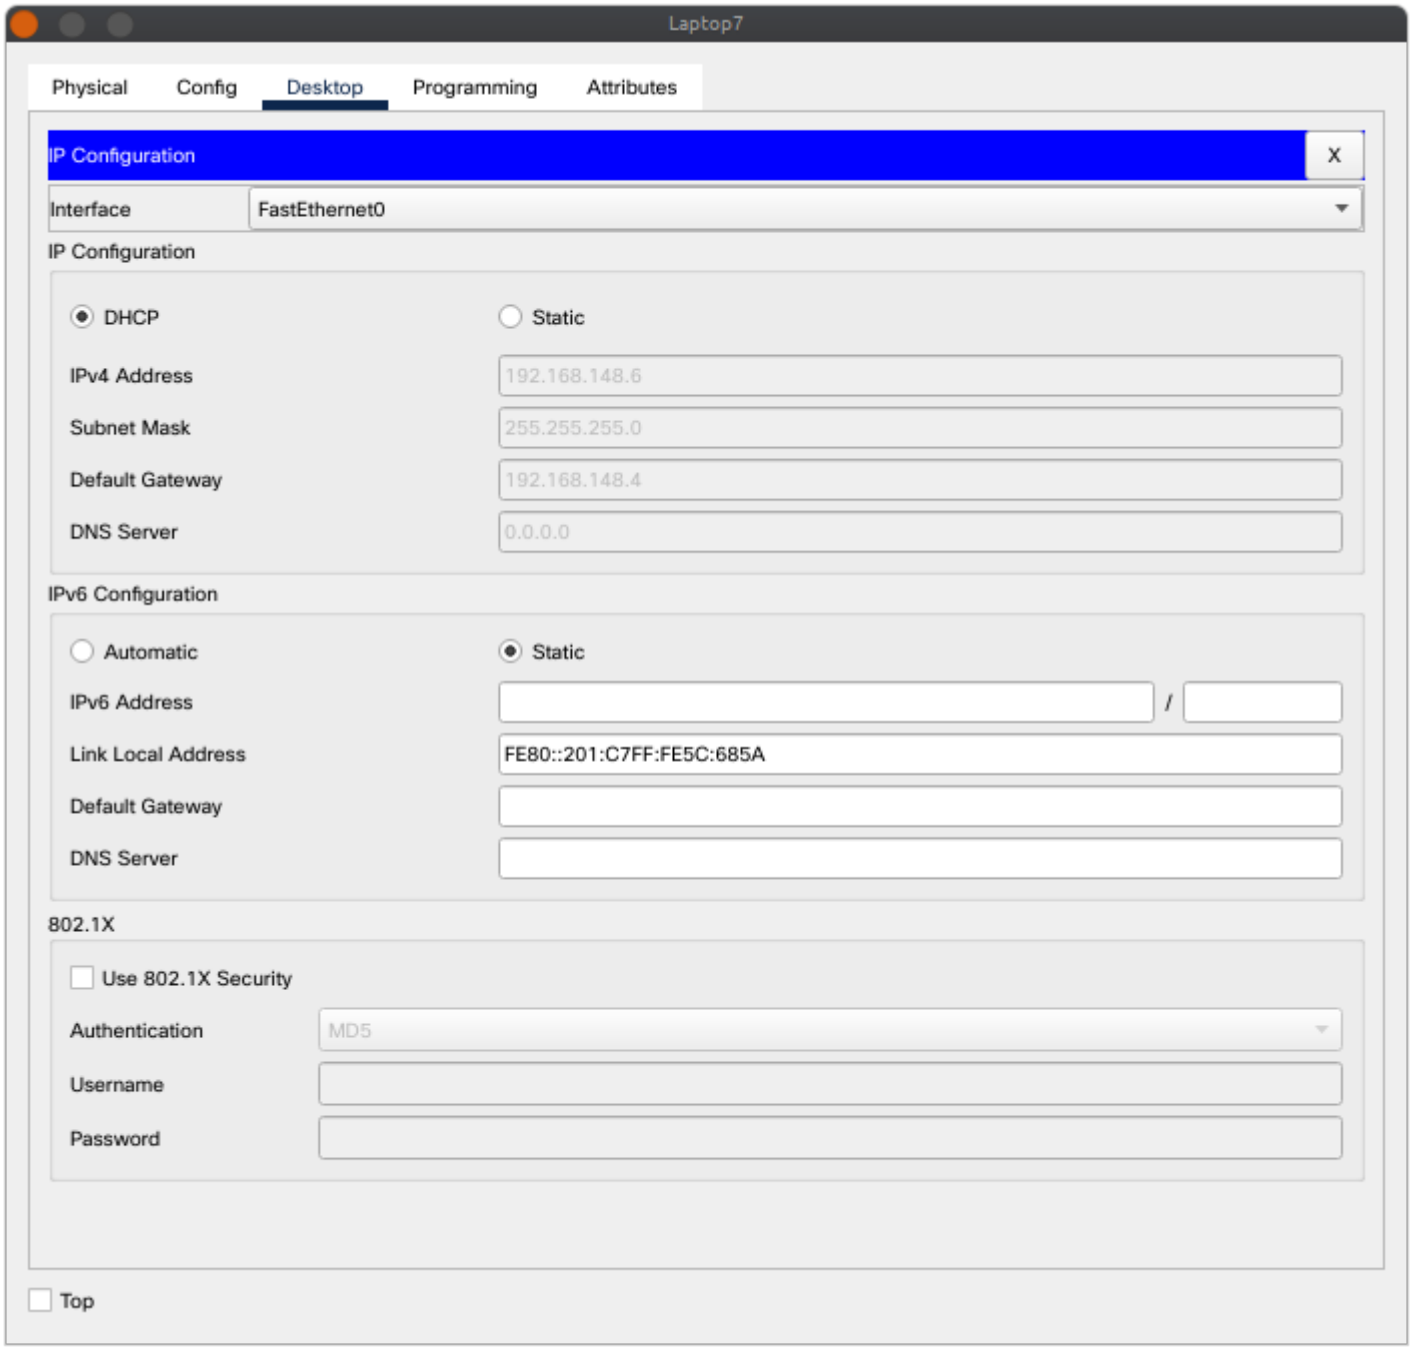
Q6. Add servers to the individual LANs (in problem 5) and configure them as a DHCP server. Configure the hosts in the individual LAN to obtain IP addresses and address of the default gateway via this DHCP server.

In each LAN, a server was added and it was configured as a DHCP server. The default gateway was set to the IP of the router of that particular interface. The IP of the server is set as 192.168.148.5 in JU MAIN and 192.168.149.5 in JU SL. Now, when new hosts are added, IP address and gateway is provided via the DHCP server.



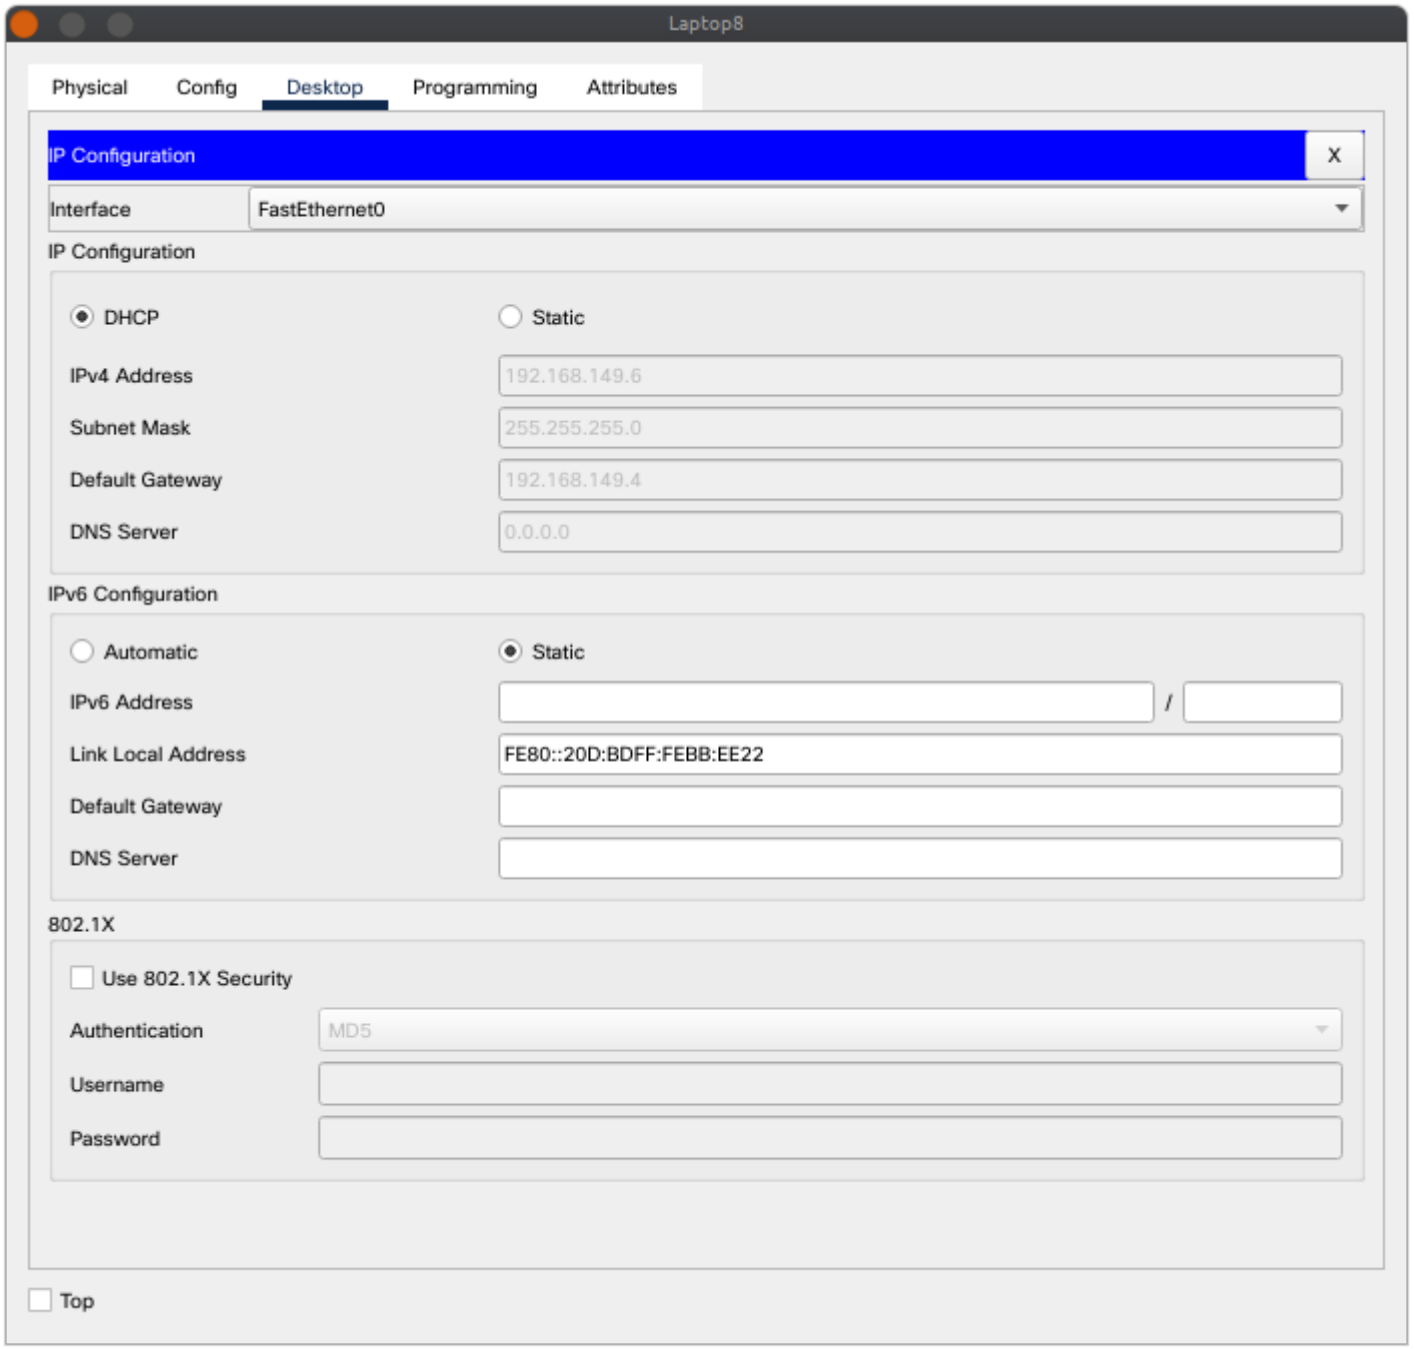
Now, when a new host is added in JU MAIN:

Assigned IP: 192.168.148.6
Gateway: 192.168.148.4



Now, a new host is added in JU SL:

Assigned IP : 192.168.149.6
Gateway: 192.168.149.4



PING command was also successfully executed between the new hosts that were created via the DHCP server:

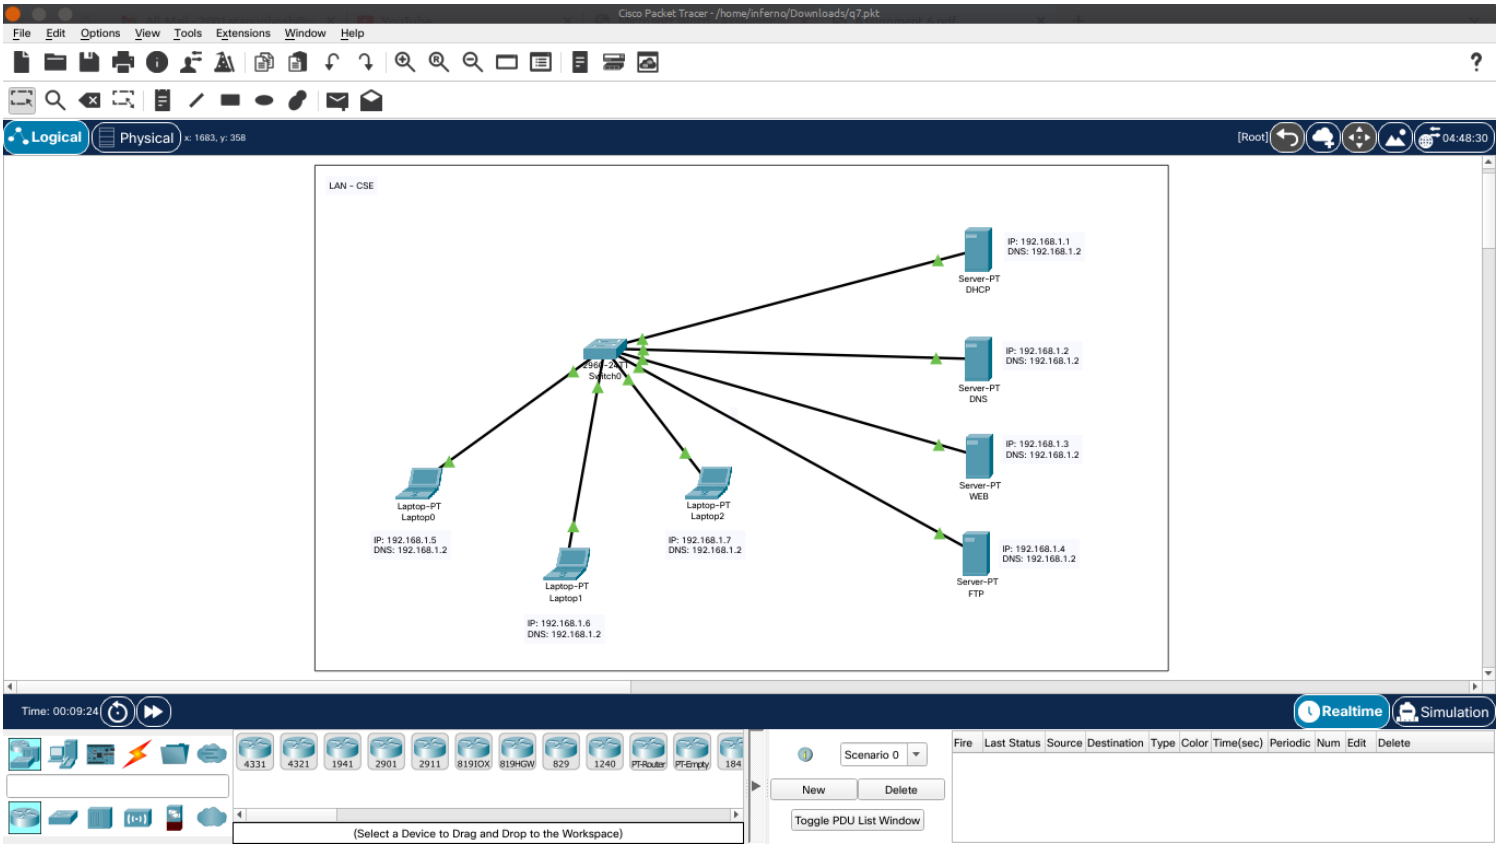
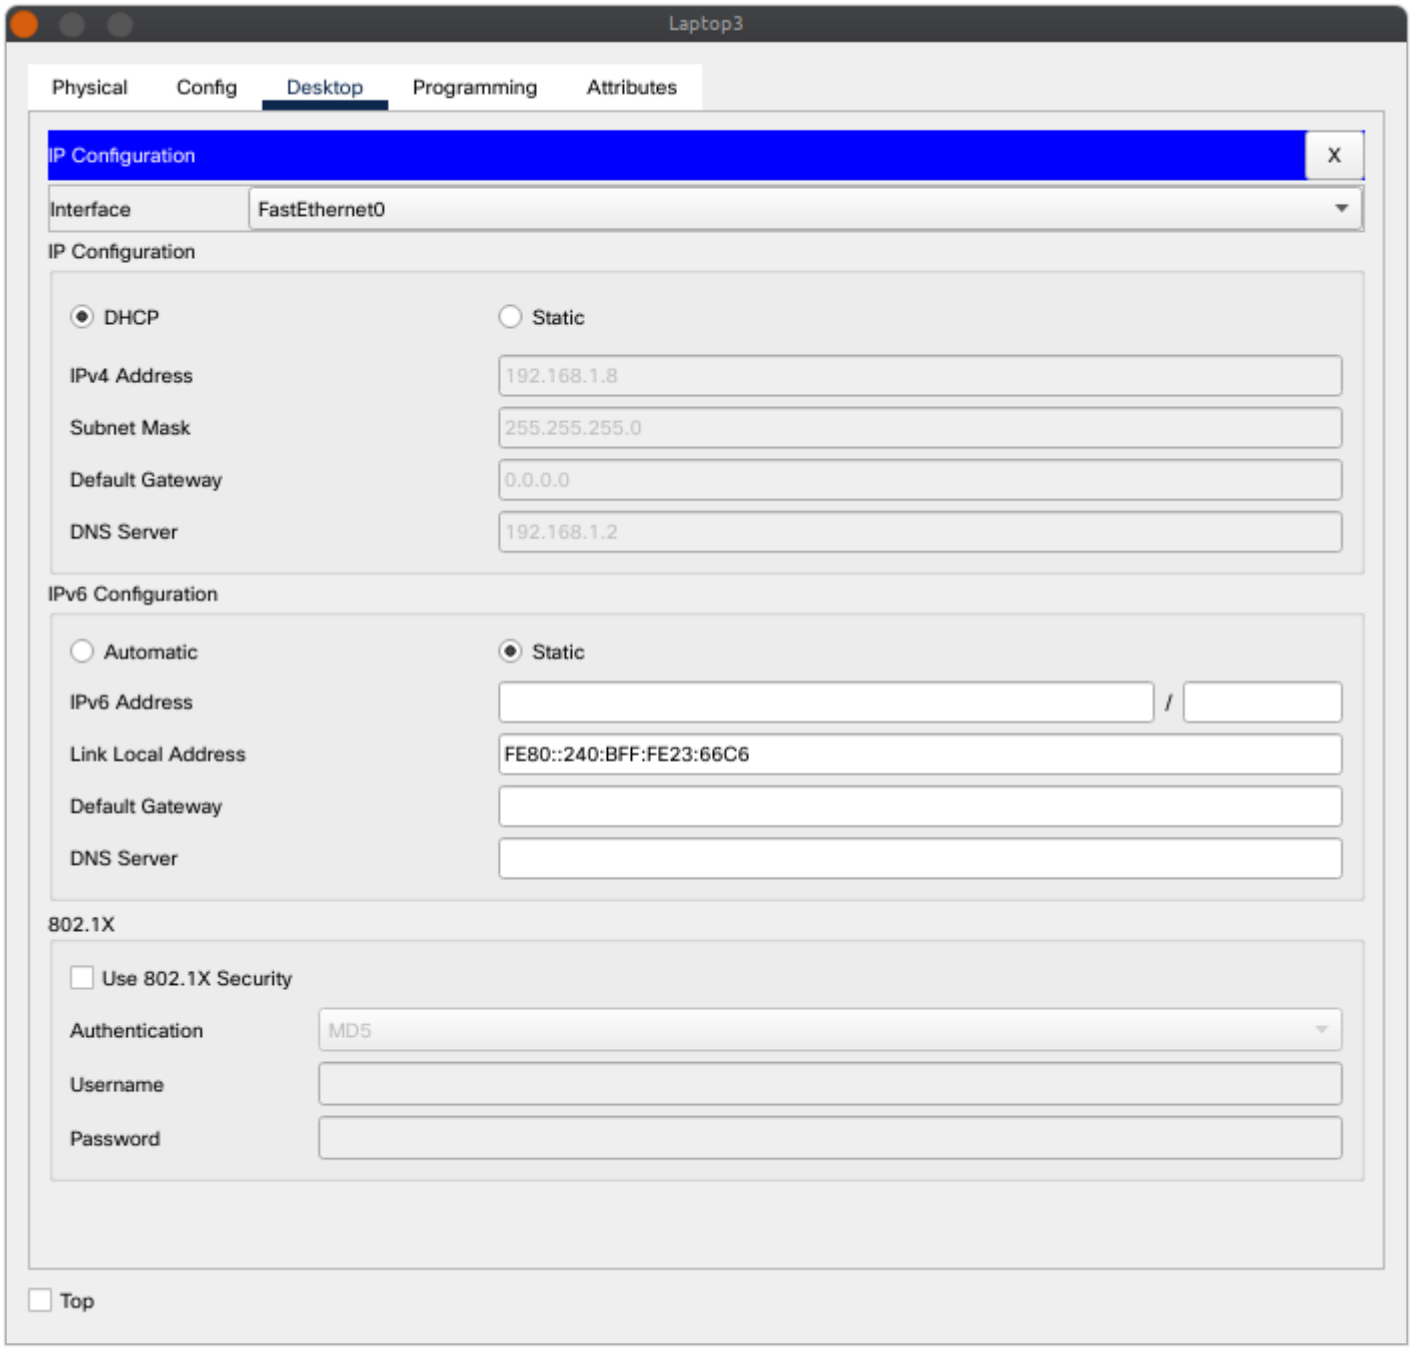
Q7. Create a LAN (CSE) with three hosts connected via a layer-2 switch (Cisco 2950 switch CSE-Switch). Also add a web server and a ftp server to this LAN. The hosts dynamically get their IP addresses from a local DHCP server. Servers are assigned fixed IP addresses. Configure the individual hosts to use the local DNS server for name resolution. Add a Domain Name Server (DNS) to this LAN. Create appropriate records in the DNS server for the individual servers in the LAN. The domain name of the LAN is cse.myuniv.edu. Configure the individual hosts to use the local DNS server for name resolution.

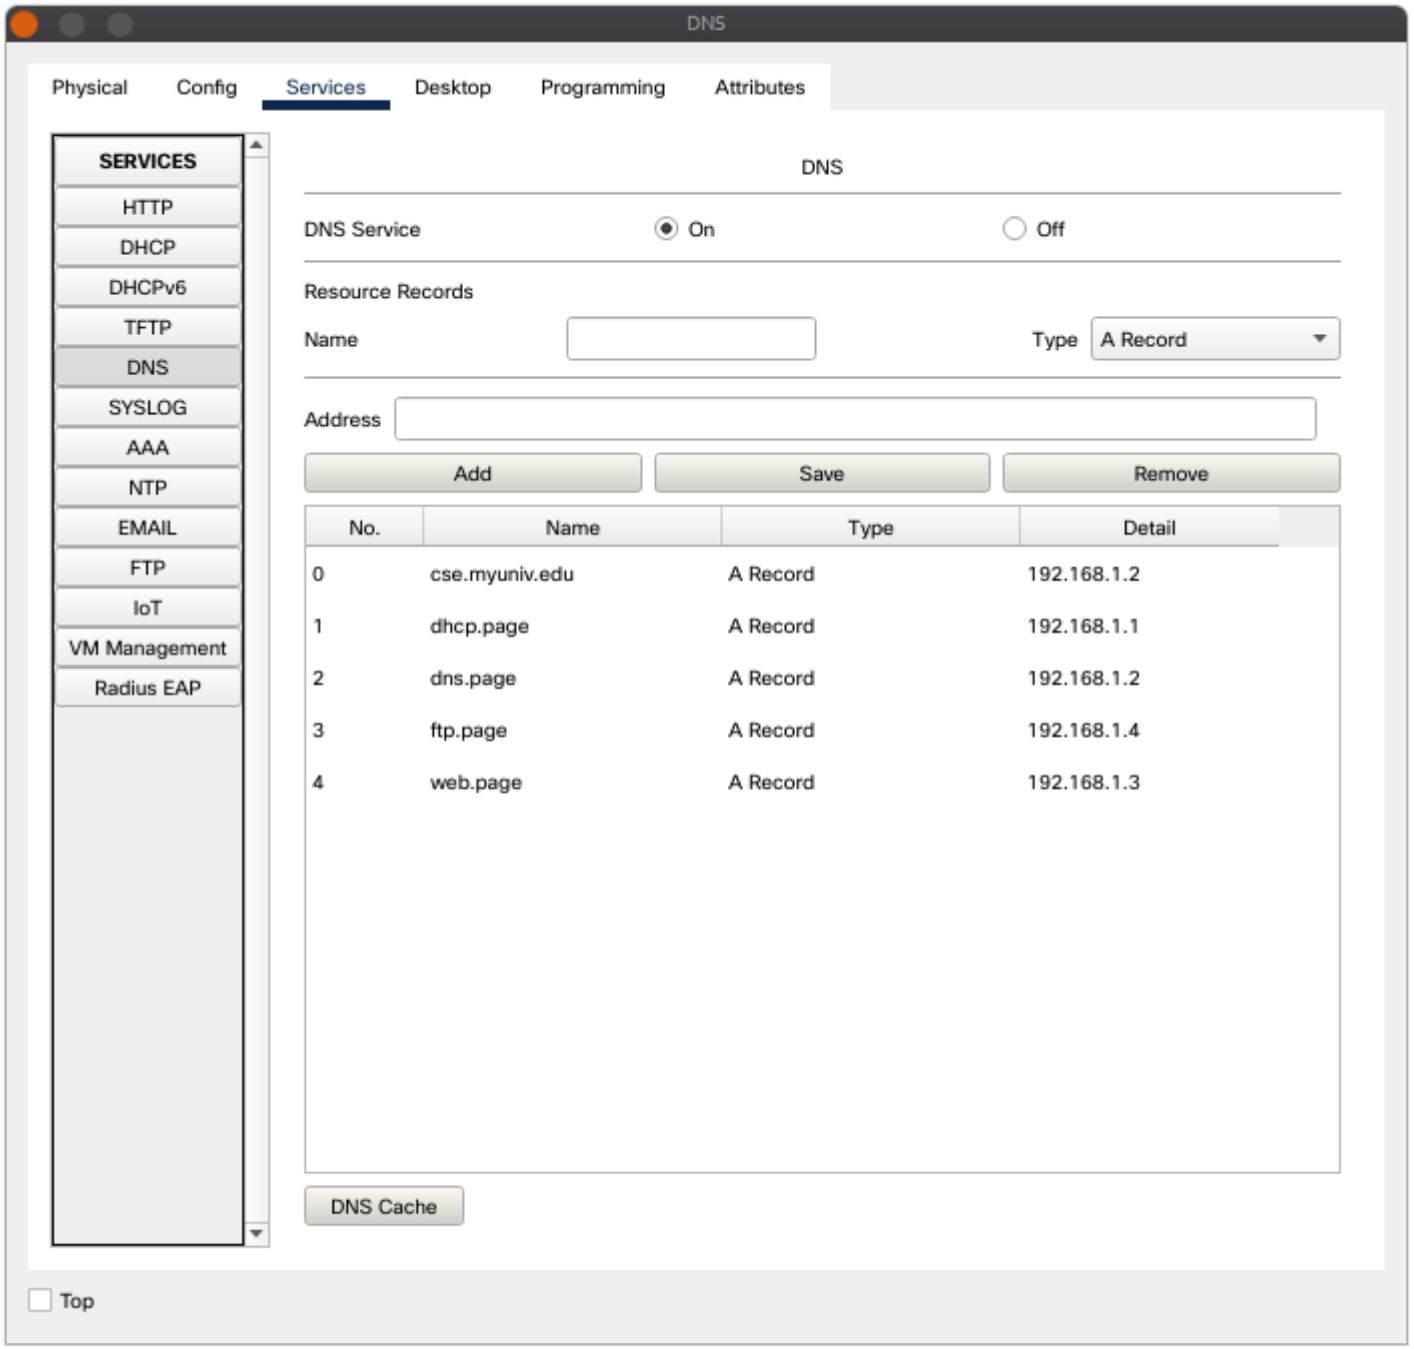
A LAN was created using a switch and three hosts. Four servers were also added to the switch as per the given question. One of them is the DHCP server which was configured so that the hosts added to the switch could generate their own IP address using the DHCP server. A WEB and an FTP server were also added. A DNS server was added and configured. Now, the following were obtained.



Dynamic IP address generation for a new host:



The DNS record table is made as follows:



On using the web browser in a host computer connected to the LAN:

COMMENTS

This was a very interesting and unique assignment. It led me to learn to use a new utility tool Cisco Packet Tracer. I had to explore a lot to perform the experiments and it was really a very exciting experience. Overall, I found this assignment very informative.
